1 Page Styles

The `\pagestyle` command controls the appearance of headers and footers.
Some predefined page styles are:

- **plain**: Displays the page number at the bottom of the page.
- **empty**: Removes headers and footers.
- **headings**: Displays section or chapter headings in the header.

2 Customizing Page Margins

The geometry package allows us to customize the margins of a document.
For example, the current document uses:

```
\usepackage{geometry}
\geometry{
    left=2.5cm,
    right=2.5cm,
    top=2.5cm,
    bottom=2.5cm
}
```

3 Custom Headers and Footers

The fancyhdr package allows us to customize the header and footer.

- `\fancyhf{}` clears existing header and footer settings.
- `\fancyhead[L]` sets the left header.
- `\fancyhead[C]` sets the center header.
- `\fancyhead[R]` sets the right header.
- `\fancyfoot[C]` sets the center footer.

4 Paragraph Spacing

We can control paragraph indentation and spacing.

This is the first paragraph. It demonstrates the paragraph indentation and spacing settings.

This is the second paragraph. Notice the additional vertical space between paragraphs.

5 Horizontal and Vertical Spacing

Horizontal spacing:

This is spaced text.

Vertical spacing:

This is the first line.

This is the second line after vertical spacing.

6 Page Breaks

The `\newpage` command starts the following content on a new page.

This content starts on a new page.

7 Customizing Section Headings

8 Page Background Color

The xcolor package allows us to change the background color of a page.

This page has a dark yellow background.

The original background color is restored.

9 Customizing Lists

The enumitem package allows us to customize the appearance of lists.

- First customized item.
- Second customized item.
- Third customized item.

I. First item.

II. Second item.

III. Third item.
